

# Smart Toilet

## The "Quality time Toilet seat"

Our group focused on creating an expensive smart toilet that could be considered a status symbol the "Quality time Toilet seat". We wanted to create a smart toilet that could fulfill all the needs of the user and so it has a number of features: Self-cleaning, Auto water cleaner, Touch screen, Air freshener, Speakers, Health app, Self-warmer, Charge, Wi-Fi, Bluetooth, Ambient lights, Adjustable height. The most outstanding feature of our smart toilet the health app. The health app collects information directly from the excrements of the user and give useful information about the health condition of the user.

## Cards Feedback

As positive feedback we received that: It is a nice feature to have a personal account that stores all your data in one place and that it gives human value to the user as they receive information of how healthy they are and suggestions on what to eat to improve their health. As negatives we received that: It is possible for someone to steal your personal data or it could be used without your submission, that the toilet is not usable without Wi-fi and that there is no guide how to use it, that it is not ecofriendly, has only touch screen and that it has no adjustable water.

As we give a closer look to the feedback we received we cool work on improving the positive sides we have and we could work around with most of the negatives by creating simple solutions (e.g. no guide how to use it: put a paper guide in the box of the toilet)
